1	Janiya Green	002831712	Pathway: Undergraduate Responsibilities: Data layer, History/Insights, Settings, progress tracking, and Mission Match smart helper	10/16/26
2	Iyana Halliburton	002765290	Pathway: Undergraduate Responsibilities: UI, Mission Catalog, Create/Edit Mission, Mission Detail, and wireframes	10/16/26

Project Summary

Problem and Users

When attending college, you are usually encouraged to utilize all resources and get involved, but it can be hard to do that with a busy college schedule, especially at a school with many commuters like GSU. This app helps better than a poster or pin add could because it gives students a clear place to pick challenges, log progress toward a target, and see completed goals.

The target users are students and challenge organizers. This matters to them because students would want a clear, straight forward way to make and track goals they have to be more involved on campus and utilize their resources. A challenge organizer may be college faculty, club leaders, or anyone that needs a simple way to encourage students to do things on campus with challenges, targets, and milestones.

Core Features and Outcomes

- Mission cards: Users can see many missions available to them that they can choose to add to their own assignment and complete.
    - Easy way to see missions and details
- Category filter: Users can filter through their board and mission by choosing a category. Each mission and target has an assigned milestone.
    - Helps find a mission easier.
- Completed-count summary: The dashboard shows how many missions are finished, recalculated from the current logs.
    - Helps keep track of success
- Progress log: Users add, view, edit, and delete progress updates for each mission, with fields and notes
    - Missions are easy to track and update
- Mission Match suggestion: A mission is suggested based on match in interest/category. The user can view the mission or deny.
    - Makes mission selection even easier.

Local Storage Plan

- SQLite will be used for the challenge variables (id, title, category, targetUnits, description) and progress log variables (id, challengeId, loggedAt, units, note).
- SharedPreferences will be used to navigate categories and targets.

Equal Scope Contract

- Five screen roles: catalog/dashboard, create/edit form, detail/activity, history/insights, and settings
- Two related entities with CRUD for both: Challenge and ProgressLog are out two related entities. They are linked by challengeId and they both help manage challenges and missions.
- Stateless/stateful widgets: One complete stateful workflow: Mission cards and labels will be stateless because they display standard information that does not need to be interacted with unless chosen. The stateful widgets will be the progress form, target slider, filter, and finish/reset controls since these all need to be modified to user preference.
- Buttons: The buttons will start, save, log progress, delete, finish, and reset.
- A meaningful numeric control: The target slider will only have positive values and a progress input.

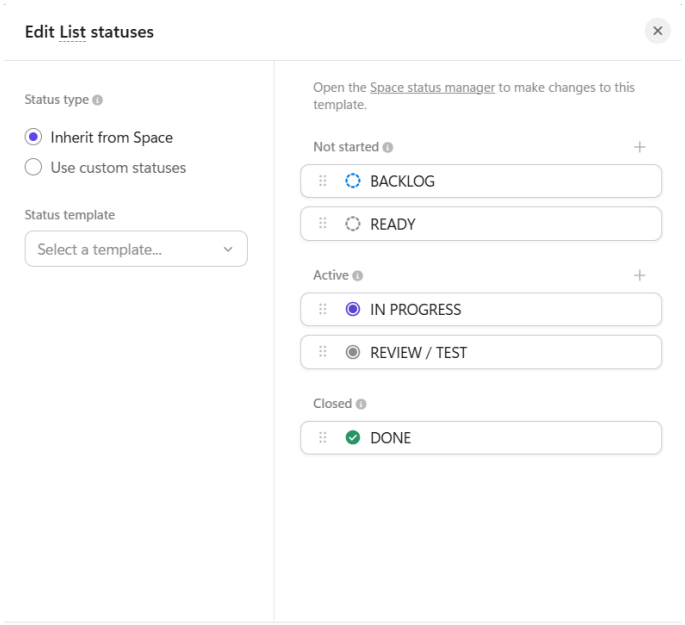

- One activity/filter/aggregate: Changing a filter will start with "start", then "log" and then "finish" or "reset". You can filter with the category filter.
- Restart/offline tests: WIFI will be turned off and airplane mode will be turned on. The goal is for the records and set preferences to survive after the app is restarted on the device. Then we will test having an invalid target and having multiple completions of challenges and missions.

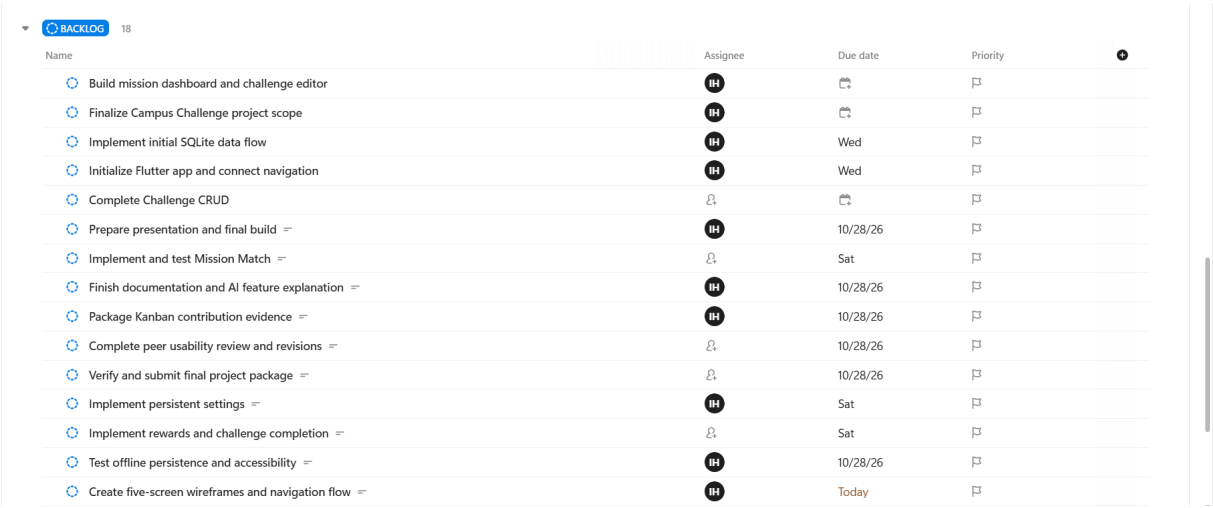

Required AI learning component

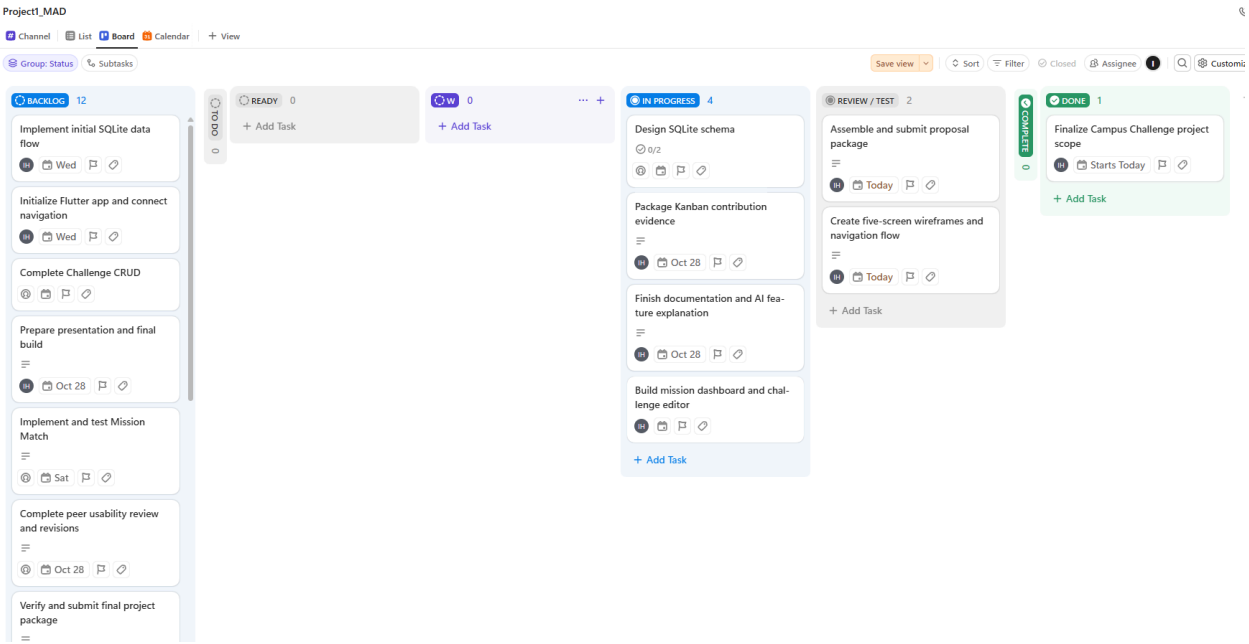

- Helper: Mission Match
- User benefit: This helps the user choose missions faster by rev=cieving a suggested mission.
- Input fields/units: A preferred challenge category, each local challenge category, and whether its target status based on period.
- Suggestion/explanation/override: TO override, the available missions are "View details" and “Not now”.
- Method label: Rule-based smart helper
- Simple baseline: The mission ID order.
- Owner: Iyana Halliburton
- Evaluation plan: The plan is to use the normal, no data, invalid input, a tie, and the counterexample cases to do the evaluation of the app and its results. It will have input values and changes, expected result, actual result, and pass/fail outcomes, a comparison against the baseline.
- Alternative: The suggested Alternative is a nearest-neighbor classifier with local labeled examples.
- Case Types
    - Normal: We will test by adding 2 missions that are not done and not the same category, and 1 that is done that is the same category as another. The matching category will be the category preference set. The outcome should be the helper suggests the unfinished art mission with the reason “Matches art + still unfinished,”. The ID order should suggest the other mission.
    - Empty/insufficient input: We will test an empty mission catalog. As a result, the card should show “Add a challenge first” and the app wont crash or show a blank suggestion.
    - Invalid input: We will test a blank/unknown preferred category. Afterwards, the helper should not take the invalid preference and should show clear feedback.
    - Boundary/tie/outlier: We will test two missions with equal scores, and a mission that has a log that meets its target. After the test, the lower mission ID should be picked and the mission that has a met target is marked as done.
    - Counterexample: We will test a catalog where the only preferred mission available is finished and the only other unfinished mission is not preferred. It's expected that the helper may suggest the finished mission, but it would be better for it to only show the unfinished one.

Proposed Wireframe (UI Visual Plan)

- Layouts:

- Functionality:
  - 1. Home: This page lets the user view challenges and progress.
  - 2. Create / Edit Challenge: This page allows users to add or update a challenge.
  - 3. Challenge Details: This page is made to record progress and complete challenges.

    - 4. History: This page lets users review and manage past activity.
    - 5. Settings: This page is used to change and save preferences.
- User Experience:
    - Home/Dashboard: The user will see this dashboard upon opening the app. It provides a quick overview of the user's challenges and progress. Here they can browse challenge cards, view progress, and select Add Challenge. If no challenges exist, the screen will display a message explaining how to create one.
    - Create / Edit Challenge: This screen has a simple form to allow the user to add a challenge. Required fields like description will be modified and then saved. Invalid input from the user will show error messages and won't save.
    - Challenge Details: This screen helps the user understand more about a challenge. Users can get more information about a challenge as well as record progress or activity entries.
    - History: This screen helps users see all their past activities and challenges. Users can review dated entries and update or remove records. If there is no history, then the screen has an empty message and container,
    - Settings: This screen shows simple controls for customizing the user experience. Preference changes will be saved on the device and will not change when the app restarts.
- Iterative Design:
    - Test Case 1: Add challenge
        - We will enter valid information for a new challenge and save.
        - The expected result is to see the challenge appear on the home page.
    - Test Case 2: Delete Logged Activity
        - We will delete an activity entry for a challenge.
        - The expected result is to see the entry disappear from the history page and the completed activities values to change.
    - Test Case 3: Invalid Challenge Input
        - We will enter valid information for a new challenge but add no title and save.
        - The expected result is to see an error message on the page and for the challenge not to save.
